OBJECTIVES

Palbociclib is a CDK4/6 inhibitor for ER(+)/HER2(-), metastatic breast cancer (MBC). Studies show progression-free survival is better among Palbociclib patients than among patients receiving endocrine therapy. Whether the frequency of adverse effects (AEs) in real world settings differs between patients receiving Palbociclib and patients on other endocrine therapies is lacking. The aims of this study are to investigate whether: (1) the occurrence of AEs in patients receiving Palbociclib and Letrozole differ from patients receiving an aromatase inhibitor (AI) as first line therapy; and (2) the occurrence of AEs in patients receiving Palbociclib and Fulvestrant differ from patients receiving second-line endocrine therapy (ET).

METHODS

A health research network representing over 19M female patient-lives was used to define patients 45+ years old, with a MBC diagnosis between 2013-2017, who are ER(+)/HER2(-). The following AEs were defined by an ICD and/or LOINC code: acute respiratory infections, osteoporosis, fractures, weakness, bleeding events, mood disorders, and elevated ALT. Baseline characteristics (Tables 1-3), Kaplan-Meier survival analyses (Figure 1), risk ratios and 95% CIs (Figure 2) were calculated for each AE.

Table 1. Demographics characteristics

Palbociclib and Letrozole vs. AI						Palbociclib and Fulvestrant vs. ET					
	Mean ± SD	Min	Max	Patient Count	% of Cohort	Mean ± SD	Min	Max	Patient Count	% of Cohort	
Age at Index	64.03 ± 9.49 64.83 ± 10.08	46	90	910 8,605	100% 100%	65.41 ± 9.58 64.74 ± 9.81	47	90	570 2,123	100% 100%	
Hispanic or Latino				56 461	6% 5%				21 90	4% 4%

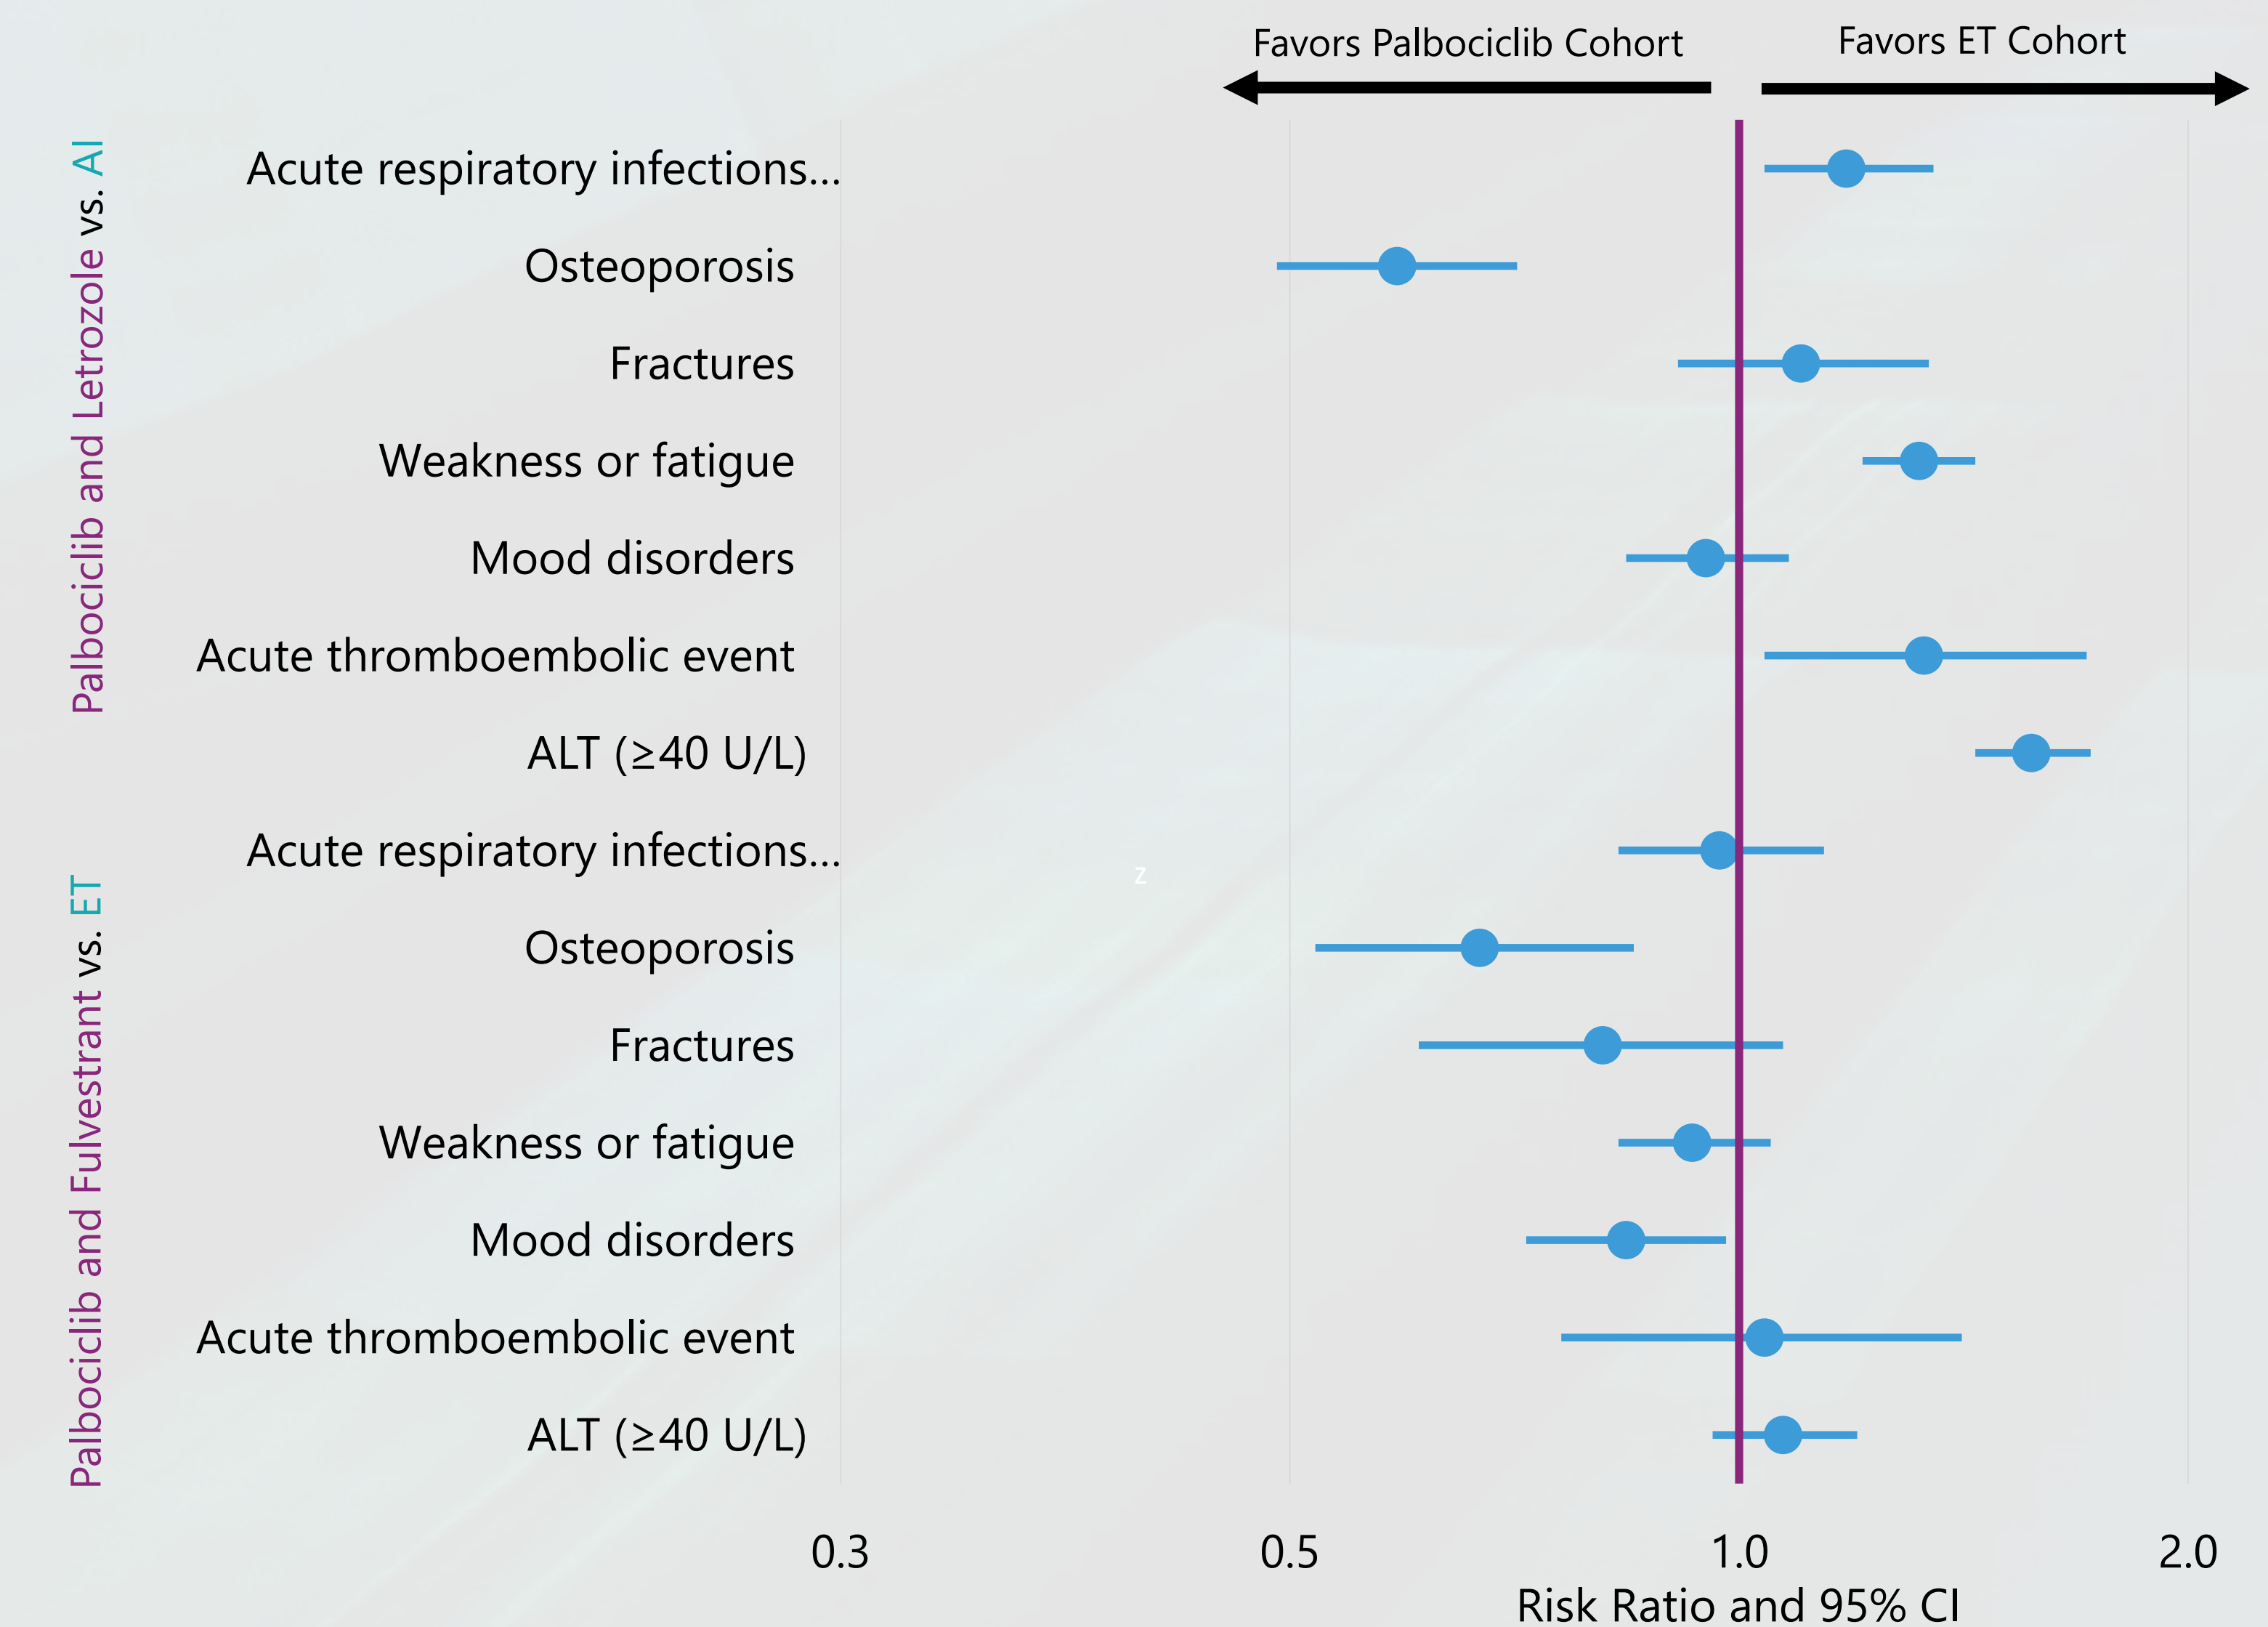

Figure 2. Effect estimates

Palbociclib and Letrozole vs. AI

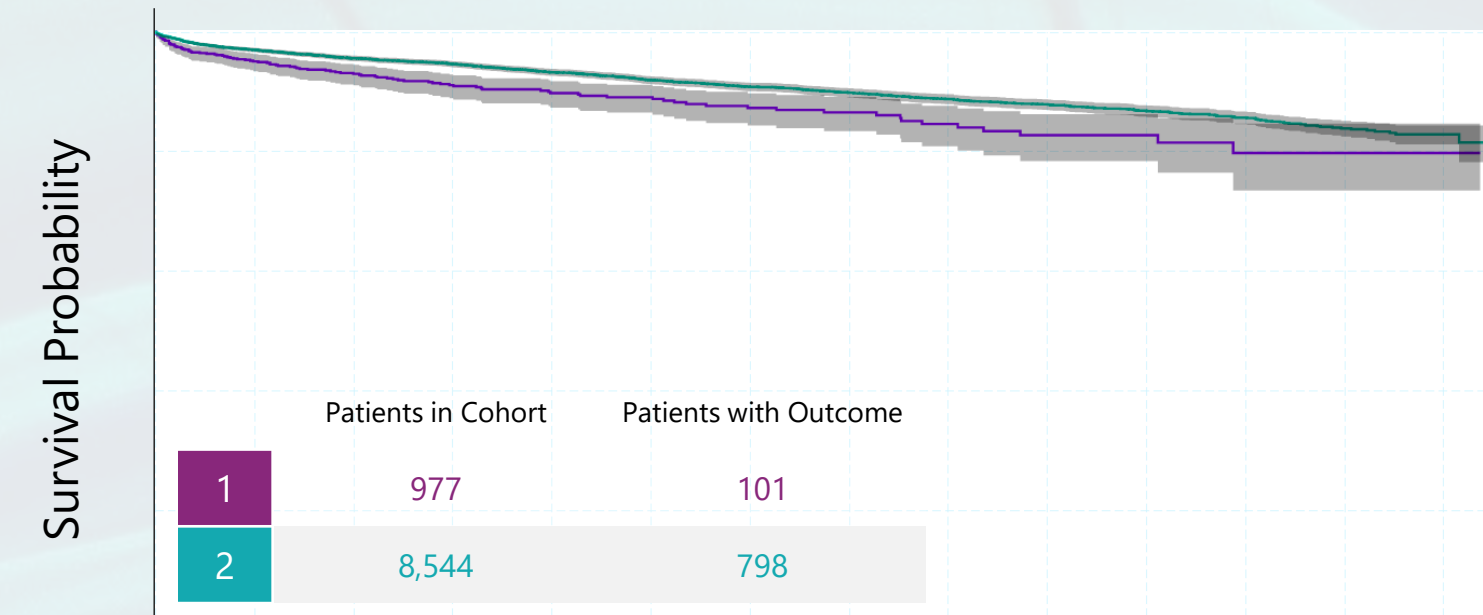

Acute Respiratory Infections

Osteoporosis

Fractures

Weakness or Fatigue

Mood Disorders

Acute Thromboembolic Event

ALT ≥ 40 U/L

Note: Survival probability on y-axis ranges from 0-100%; Number of days of follow-up on x-axis ranges from 0 to 1,300 days.

Figure 1.

RESULTS

- Patients in the Palbociclib and endocrine therapy (ET) cohorts are comparable on age at diagnosis, race and ethnicity.
- At baseline, patients receiving Palbociclib had a high prevalence of liver related diseases, but a lower prevalence of mood disorders, hypertension, neutropenia, and hypertensive medication.
- Compared to first-line AI patients, Palbociclib patients had a lower risk of osteoporosis.
- Compared to first-line AI patients, Palbociclib patients had a higher risk of bleeding events, acute respiratory infections, weakness or fatigue, and elevated ALT.
- Compared to ET patients, Palbociclib patients had a significantly lower risk of osteoporosis and mood disorders.

CONCLUSIONS

Although studies have demonstrated benefits of Palbociclib treatment over endocrine therapies, patients receiving Palbociclib may have an increased risk of infection and bleeding. As Palbociclib and other newly approved therapies in the same class become more common, further analyses should assess whether these differences raise concern for patient safety.
